COMP3311 20T3 Exam

Sample Solutions

These solutions are simply suggestions. In most cases many alternatives exist which would be equally correct and also worth full marks. Note that the order of tuples does not matter one bit in the SQL questions. The test scripts set the order themselves.

Q1

```
-- COMP3311 20T3 Final Exam
-- Q1: view of teams and #matches

create or replace view of teams in the content of the content o
```

Q2

```
-- COMP3311 20T3 Final Exam
-- Q3: team(s) with most players who have never scored a goal
create or replace view PlayersAndGoals (player, team, ngoals)
select p.name, t.country, count(g.id)

a. ER-style mapping for subclasses:

```
create table Employee (
       id
                   integer,
       name
                   text,
       position
                   text,
       primary key (id)
);
create table PartTime (
                   integer references Employee(id),
       fraction
                   float check (0.0 < fraction and fraction < 1.0),
       primary key (id)
);
create table Casu
                       s://powcoder.com
       primary key (id)
);
create table Hoursworked ent Projectal Exam Help
                   date,
       onDate
       starting
                   time,
       ending
                   time,
       constraint timing check (starting < ending)
);
```

We cannot enforce the the transport of the disjoint subclasses constraint (an employee may have several associated subclass tuples).

b. Single-table mapping Are to as we Chat powcoder

```
create table Employee (
        id
                     integer,
        name
                     text,
        position
                     text,
                     text not null check (etype in ('part-time', 'casual')),
        etype
                     float check (0.0 < fraction and fraction < 1.0),
        fraction
        primary key (id),
        constraint CheckValidTypeData
                        check ((etype = 'part-time' and fraction is not null)
                               or (etype = 'casual' and fraction is null))
);
create table HoursWorked (
                     integer references Employee(id),
        onDate
                     date,
        starting
                     time,
        ending
                     time,
        primary key (id, onDate),
        constraint timing check (starting < ending)</pre>
);
```

With an appropriate CheckValidTypeData constraint we can enforce the disjoint subclass constraint. With the not null requirement on etype, we can enforce the total participation constraint. The etype field could be replaced by a boolean which checks isCasual.

It is also feasible to omit the etype field and simply assume that fraction being not null means that the employee is part-time.

In neither case can we enforce that part-time employees do not have hours-worked associated with them.

Q9

a. Trigger to handle adding a new CourseEnrolments tuple:

```
create function fixCoursesOnAddCourseEnrolment() returns trigger
as $$
declare
        _nS integer; _nE integer; _sum integer; _avg float;
begin
        select nS,nE,avgEval into _nS,_nE,_avg
        from Courses where id=new course
        -- add one ndre student UU
        _ns := _nS + 1;
        if (new.stuEval is not null) then
             ssignment, Project Exam Help
                if (\_nS \le 10 \text{ or } (3*\_nE) \le \_nS) \text{ then}
                         -- added a new student, but still not enough for valid eval
                         select sum(stuEval) into _sum
                         from CourseEnrolments where course=new.course;
                    S://powender.scrym
_wg:=_sum::float/_nE;
                end if;
        end if;
        -- update Courses set ns = _ns, nE = _nE, avgEval = _avg
        where id=new.course;
        -- since "after" trigger, return value irrelevant
        return new;
end;
$$
language plpgsql;
```

b. Trigger to handle dropping a CourseEnrolments tuple:

```
create function fixCoursesOnDropCourseEnrolment() returns trigger
as $$
declare
    _nS integer; _nE integer; _sum integer; _avg float;
begin

select nS,nE,avgEval into _nS,_nE,_avg
from Courses where id=old.course;
-- we always add one more student
    _nS := _nS - 1;
if (old.stuEval is not null) then
-- lost an evaluation
    _nE := _nE - 1;
if (_nS \leq 10 or (3*_nE) \leq _nS) then
-- no longer enough for valid eval
    _avg := null;
```

```
else
                        -- compute new evaluation
                        select sum(stuEval) into sum

                        where course=old.course and student<>old.student;
                        avg := sum::float / nE;
                end if;
        end if;
        -- update Course record
        update Courses set nS = _nS, nE = _nE, avgEval = _avg
        where id=old.course;
        -- since "after" trigger, return value irrelevant
        return old;
end;
$$
language plpgsql;
                                       oder.com
```

c. Trigger to handle updating a CourseEnrolments tuple:

```
create function fixCoursesOnModCourseEnrolment() returns trigger
         Assignment Project Exam Help
declare
        newEval integer;
                          oldEval integer;
       _ne integer; _ns integer; _sum integer; _avg float; _ssion416611
        selectors, ne, avgeval into _ns, ne, avg
        from Courses where id=old.course;
        if (old.stuEval is null and new.stuEval is not null) then
       end if;
        -- treat NULL as zero for arithmetic
       -oldeval decodese of strey of worder
       if (_oldEval <> _newEval) then
               -- compute new evaluation
               select sum(stuEval) into sum
               from CourseEnrolments where course=old.course;
                avg := ( sum - oldEval + newEval)::float / nE;
       end if;
        -- update Course record
       update Courses set nS = _nS, nE = _nE, avgEval = _avg
       where id=old.course;
        -- since "after" trigger, return value irrelevant
       return new;
end;
$$
language plpgsql;
```

- a. The code prints a list of teams and the number of matches they have played in each city.
- b. The outer query (teams) is executed once, and returns 100 tuples (assumption). For each of these, one (inner) query (count) is executed. Total calls to execute() = 101.
- c. Python code to achieve the same effect with a single query:

https://powcoder.com

a. FDs: A\rightarrow BC, DE\rightarrow F, ADE\rightarrow G (also accept A\rightarrow B, A\rightarrow C instead of A\rightarrow BC) ASSIGNMENT Project Exam Help					
b.	Step	Attrs	FDs	Key	Notes
	1	APCS5F6	AND BELLEVIES	ide t	A BC violates BCNF, LHS is partial key, so partition
	2a	ABC h	A→BC//pow	ecod	No FDs violate BCNF, so ABC is part of solution
	2b	ADEFG	DE→F, ADE→V	ADE	DE→F violates BCNF, LHS is partial key so partition
	3a	DEF	DE→F	DE DE	No FDs violate BCNF, so DEF is part of solution
	3b	ADEG	ADE→G	ADE	No FDs violate BCNF, so ADEG is part of solution

Solution: three tables: ABC, DEF, ADEG (i.e. Student, Assessment, Mark)

Q12

a. Which employees earn more than \$20 per hour (give their employee id and name)

```
Tmp1 = Sel[payRate>20]Employees
Res = Proj[eno,ename]Tmp1
```

b. Who are the department managers (give just their name)

```
Tmp1 = Employees Join Departments (on eno)
Res = Proj[ename]Tmp1
```

c. Which employees worked on every day during the last week (give just their name)

```
Tmp1 = Proj[day]Timesheet
Tmp2 = Proj[eno,day]Timesheet
Tmp3 = Tmp2 / Tmp1
Tmp4 = Employees Join Tmp3 (on eno)
Res = Proj[ename]Tmp4
```

Would expect to see division used ... if not, but still correct, ok, e.g.

```
Tmp1 = Proj[eno](Sel[day='Mon']Timesheet)
Tmp2 = Proj[eno](Sel[day='Tue']Timesheet)
...
Tmp7 = Proj[eno](Sel[day='Sun']Timesheet)
Tmp8 = Tmp1 Intersect Tmp2 Intersect ... Tmp7
Tmp9 = Employees Join Tmp8
Res = Proj[ename]Tmp9
```
